CLAUDE-FIRST FELLOWSHIP · WEEK 6

INSTRUCTIONS

Ship it — the capstone

Turn last week's scope into a real, working product and prove it live — a shipped app with Claude at its centre, and a five-minute Demo Day pitch.

Week 6 · Claude (full stack) · Gamma · Your capstone stack · GitHub · Replit

Your turning point in the AI era.

Ship it — the capstone

Milestone Project 4 · The brief

WHAT YOU'LL BUILD

The capstone. You take the **scope and skeleton from Week 5** and finish it into a product someone could actually use — then you **present it live**. Claude is not hidden plumbing here; it is on stage. The week ends with a five-minute Demo Day: a short deck, and the real thing running in front of the room.

- A **working product** built from your Week 5 scope — one flow, done well.
- Claude **visible and central** — an MCP call, a Routine, or live reasoning the audience can see.
- A **polish pass** — errors, loading, edge cases, reliability and mobile all handled.
- A **5-slide Gamma deck** — Problem · Solution · Demo · Stack · Impact.
- A **5-minute Demo Day** — two minutes of deck, three minutes live.

WHY IT MATTERS

Five weeks of skills come down to one thing: **can you ship and show it?** The title of AI Generalist is demonstrated, not given. A working product you can demo under pressure is the proof — and the portfolio piece you carry into every interview after.

WHERE IT RUNS

Your Week 5 stack for the build, Claude across the whole thing, Gamma for the deck, and a live URL anyone can open during the demo.

WHEN TO BUILD & USE IT

Build and polish in the first session; present on Demo Day. Rehearse the five minutes at least once before you stand up.

Ship it — the capstone

How to approach it

THE METHOD

The path to a shipped demo. Each step is yours to make real — the Solution book walks one version of it, finishing the StudyLoop app from Week 5.

1. **Build from your scope, don't restart.** Open the Week 5 repo and extend it. Working beats clever; finish one flow end to end.
2. **Make Claude visible.** Pick one moment the audience can see the AI work — a tool call, a Routine firing, reasoning on screen.
3. **Run the polish pass.** Errors, loading states, edge cases, MCP reliability, mobile. These are what break a live demo.
4. **Build the 5-slide deck in Gamma** — Problem, Solution, Demo, Stack, Impact. One idea per slide.
5. **Write the demo script and rehearse.** Two minutes of deck, three minutes live, timed — and record a fallback clip.
6. **Demo live, then submit the write-up** — a README, a short video, and a paragraph on what you built.

REQUIREMENTS

- [ ] A working product with Claude visible.
- [ ] A polished happy path that survives a live run.
- [ ] A 5-slide Gamma deck.
- [ ] A rehearsed, timed 5-minute demo + fallback clip.

HAND IN

The **live product URL**, the **Gamma deck**, a **demo video or recording**, and a **capstone write-up** (README + a paragraph on what it is and what you learned).

A LITTLE HINT

Rehearse the **happy path** until it is boring, and keep a **recorded clip** as a fallback. A demo that shows one thing working flawlessly beats one that reaches for five features and stalls on the first. Show the best, not everything.
