WEEKLY ASSIGNMENT · WEEK 4

MY AUTOMATED AI SYSTEM

Build infrastructure that runs without you.

The task

Build a complete Automated AI System: a multi-step N8N or Make workflow with Claude as the intelligence layer, Claude Routines handling the native steps, MCP connections to 3+ tools, and a voice layer built with VAPI or ElevenLabs. It must solve a real problem — student onboarding, customer intake, content pipeline, research assistant, or appointment system — and run end to end without manual input.

HOW TO DO IT

1. Pick one use case — A student assistant, B intake system, C content pipeline, or D your own.
2. Design the agent: write its system prompt as Goal · Tools · Memory · Escalation, and save it as /agent-brain.
3. Build a 5-step Claude Routine: research → summarise → format as JSON → store to Notion → notify Slack.
4. Wire it into N8N or Make: a webhook trigger → the Claude API (HTTP node) returns JSON → conditional routing → Notion + Airtable.
5. Add the voice layer with VAPI or ElevenLabs — a live call, or a generated voice response.

HINTS

- Design the agent first: Goal · Tools · Memory · Escalation.
- Every Claude step in STAR; end with “strict JSON only”.
- Prove the loop runs with zero manual input.
- 3+ tools connected by MCP — Notion, Slack, Airtable.
- Record the demo: show it running + a voice turn.

YOUR SYSTEM MUST HAVE

- [ ] A multi-step N8N or Make workflow with Claude as the intelligence layer
- [ ] Claude Routines handling the native steps
- [ ] MCP connections to 3+ tools
- [ ] A voice layer (VAPI or ElevenLabs)
- [ ] Runs end to end on a trigger, no manual input

Submit — a live system + a demo video (show it running, a voice interaction, the data output). **You’re done when** it runs on a trigger with no manual input and a non-technical person could use it.
