WEEKLY ASSIGNMENT · WEEK 5

SCOPE IT, SCAFFOLD IT

Plan the product. Scaffold the MVP.

The task

Produce a complete capstone brief — problem, target user, solution, tech stack with a justification for each pick, and your Claude architecture (system prompt, MCP tools, Routines). Then scaffold the MVP: write and test a **CLAUDE.md**, create the file / folder structure, and get a first working component or route live on Replit.

HOW TO DO IT

1. Write the brief — problem, target user, solution, success criteria.
2. Choose the stack — frontend, backend, deploy, model — and justify each pick.
3. Design the Claude architecture — system prompt, the MCP tools it needs, any Routines.
4. Write CLAUDE.md — goal, stack, conventions, never-do — and test it in Claude Code.
5. Scaffold the MVP — folder structure + a first route live on Replit (a real URL).

HINTS

- One sentence for the problem, one for the solution — if you can't, narrow it.
- Justify every tech pick in one line: "why this, not that".
- CLAUDE.md is your most important file — goal, stack, rules, file map.
- Ship the smallest thing first — one route that loads beats a perfect plan.
- Keep the scope demo-able inside Week 6's 90-minute build sprint.

YOUR SKELETON MUST HAVE

- [ ] A product brief — problem, user, solution, success criteria
- [ ] A tech stack with a one-line justification for each pick
- [ ] A Claude architecture — system prompt + MCP tools + Routines
- [ ] A CLAUDE.md context file, written and tested
- [ ] A scaffolded repo + a first route live on Replit (real URL)

Submit — a product brief + a scaffolded repo with CLAUDE.md + a first deployed route. **You're done when** a stranger could read your brief and your CLAUDE.md and know exactly what you're building and how.
