THE ASSIGNMENT

SHIP IT

Build it. Ship it. Demo it. Prove it.

Your Week 6 milestone — the AI Generalist Capstone. This book walks you through shipping a real product and presenting it live on Demo Day. There is no answer key.

YOUR CAPSTONE HAS FIVE PARTS

- Live product
- Claude central
- Gamma deck · 5 slides
- 5-min demo
- Portfolio write-up

WHAT, WHY, WHERE, WHEN & HOW

The whole capstone in five plain-English lines.

WHAT	Build and present a real, working AI-powered product that solves a genuine problem. Claude must be **visible and central** — MCPs, Routines or API calls live and demonstrable. Ship it, build a 5-slide Gamma deck, and demo it live in 5 minutes.
WHY	This is the proof. Five weeks of skills converge into one thing you shipped — the portfolio piece that earns the title **AI Generalist**. It is demonstrated, not given.
WHERE	Claude is the full stack — **Code** to build, **API + MCPs** as the product brain, **Routines** for autonomous features; **Gamma** for the deck; your Week 5 stack for the product.
WHEN	Week 6 — a 90-minute build sprint, then Demo Day. Build from your Week 5 scope and **CLAUDE.md** so the sprint is building, not planning.
HOW	Build from your scope → make Claude visible → polish the five demo-breakers → build the 5-slide deck → rehearse → demo live in 5 minutes.

YOUR TOOLBOX — CLAUDE

The full Claude stack — the brain and the build tool for your capstone.

C Claude Code

THE BUILD TOOL

Your primary build-and-debug tool through the sprint — it reads `CLAUDE.md` and extends or fixes the product live.

A Claude API + MCPs

PRODUCT BRAIN

The reasoning layer inside your product; MCPs give it live tool access the audience can actually see on stage.

R Routines + Schedules

AUTONOMOUS FEATURES

Product behaviour that runs on its own — a daily digest, an auto-reply — that you can trigger during the demo.

P Projects + Connectors

CONTEXT · LIVE DATA

Projects hold the full capstone context across the sprint; Connectors feed live user data in, per person.

YOUR TOOLBOX — SHIP & SHOW

What turns a working build into a shipped, demoed, proven product.

G Gamma

THE DECK

Turns a Claude brief into a 5-slide deck — Problem · Solution · Demo · Stack · Impact — in your brand.

L The polish checklist

BEFORE YOU DEMO

Error handling, loading states, edge cases, MCP reliability, mobile — the five things that break a live demo.

D The demo script

5 MINUTES

2-min deck walkthrough + 3-min live demo: problem → solution → demo → impact. One idea at a time.

W The write-up

YOUR PORTFOLIO

Capstone README + demo video — the proof you carry into a CV, a portfolio, and interviews.

SPRINT & SHOW (EXAMPLES)

1 Run the build sprint with CLAUDE.md

1. Open your Week 5 repo in Claude Code — `CLAUDE.md` loads as context.
2. Work in small loops: describe the next feature → review the diff → accept.
3. When Claude drifts, point it back at CLAUDE.md and the scope.
4. Commit often to GitHub so every working state is saved.

Like this — CLAUDE.md is your leash — it keeps a 90-minute sprint on the rails.

2 Make Claude visible in the demo

1. Pick one moment where Claude reasons or calls a tool on stage.
2. Surface it in the UI — show the MCP call, the Routine firing, or the JSON it returns.
3. Narrate it: “here Claude reads my notes and writes the quiz.”
4. The AI is the point — never hide it behind a generic spinner.

Safety — Keep a recorded clip of the happy path as a fallback if the live call fails.

DECK & REHEARSE (EXAMPLES)

Two artifacts that turn a working product into a five-minute proof.

1 A 5-slide Gamma deck from a Claude brief

1. Ask Claude for a 5-slide outline: Problem · Solution · Demo · Stack · Impact.
2. Paste it into Gamma → generate → adjust to your brand colours.
3. One idea per slide; the Demo slide is a screenshot or a live hand-off.
4. Keep the deck to 2 minutes — the live demo is the star.

2 The 5-minute demo script

1. 2 minutes deck — problem (30s) → solution (30s) → stack + impact (60s).
2. 3 minutes live — run the happy path, show Claude working, land the payoff.
3. End on the impact line, not a feature list.
4. Rehearse once out loud; time it; cut anything that doesn't earn its seconds.

THE DEMO ARC

Five beats, in order — your deck, your demo and your pitch all run on this arc.

PROBLEM

the pain, in one line — who hurts, and why now.

SOLUTION

what your product does about it, in one line.

DEMO

the single live moment you'll show on stage.

STACK

what it's built on — and where Claude sits.

IMPACT

what changes for the user — the payoff.

Your turn

Fill the five beats for your product. If the Demo beat isn't one clear on-stage moment, pick a sharper one — the demo is the whole show.

THE POLISH CHECKLIST

The five things that break a live demo. Fix them before Demo Day.

ERROR HANDLING

what the user sees when something fails — never a blank screen.

LOADING + EDGE

a visible loading state; empty, single and oversized inputs.

MCP RELIABILITY

what happens if a tool call fails — retry, then fall back.

MOBILE

does it work on a phone? Most demos are watched on one.

Tip

Walk this list out loud before you present. Four of the five demo-day failures live here — a blank error screen, no loading state, a broken MCP call, and a layout that falls apart on a phone.

THE BUILD — PICK ONE

Milestone Project 4 — the AI Generalist Capstone. A real product you ship and demo live.

- **A · AI Study Assistant** — course-specific knowledge, voice or chat Q&A, and progress tracking.
- **B · AI Startup MVP** — an agentic tool solving a real market problem, pitched as a product.
- **C · AI Automation Service** — a packaged automated system you could sell as a service.
- **D · AI Creative Platform** — a tool others use to create, produce, or publish with AI.

Must include

A live, functional product; Claude visible and central (MCPs, Routines, or API calls live and demonstrable); a real user and a real problem. Tools: Claude (Projects, MCPs, API, Code, Routines, Schedules) plus your chosen stack from the fellowship.

Submit as — a live product + a 5-slide Gamma deck + your Demo Day presentation + a capstone write-up.

NOW SHIP IT

Six moves from your Week 5 scope to a live Demo Day.

1. Pick your format — Study Assistant, Startup MVP, Automation Service, or Creative Platform.
2. Build from your Week 5 scope — keep Claude on track with your CLAUDE.md.
3. Make Claude visible — a live MCP call, a Routine, or API reasoning the audience can see.
4. Polish it — error handling, loading states, edge cases, MCP reliability, mobile.
5. Build the Gamma deck — 5 slides: Problem · Solution · Demo · Stack · Impact.
6. Rehearse once, record a fallback clip, then demo live in 5 minutes.

YOU'RE DONE WHEN

- The product runs live, in front of people, without crashing
- Claude's role is visible and central to the product
- A stranger could use it and get value from it
- The 5-slide deck tells the story in two minutes
- You could put it on your CV or pitch it to a founder

This is the one you carry with you. **Build it, ship it, demo it, prove it** — and earn the title.
